Mr. Forrest: AP Physics 2

FR #1, 2017 exam (4.37/10 avg.)

1. 10 points (suggested time 20 minutes)

Two students observe water flowing from left to right through the section of pipe shown, which decreases in diameter and increases in elevation. The pipe ends on the right, where the water exits vertically. At point *A* the water is known to have a speed of 0.50 m/s and a pressure of  $2.0 \times 10^5$  Pa. The density of water is  $1000 \text{ kg/m}^3$ .

Note: Figure not drawn to scale.

(a) The students disagree about the water pressure and speed at point *B*. They make the following claims.

- Student *Y* claims that the pressure at point *B* is greater than at point *A* because the water is moving faster at point *B*.
- Student *Z* claims the speed of the water is less at point *B* than at point *A* because by conservation of energy, some of the water's kinetic energy has been converted to potential energy of the Earth-water system.

(i) indicate any aspects of student *Y*'s claim that are correct. (1 pt)

(ii) Indicate any aspects of student *Y*'s claim that are incorrect and support your answer using appropriate physics principles. (2 pt)

(iii) indicate any aspects of student *Z*'s claim that are correct. (1 pt)

(iv) Indicate any aspects of student *Z*'s claim that are incorrect and support your answer using appropriate physics principles. (1 pt)

(b) Calculate the following at point  $B$ .

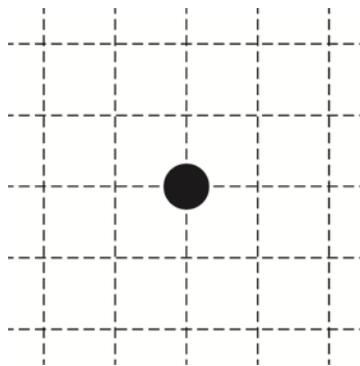

(i) The speed of the water (2 pt)

(ii) The pressure in the pipe (1 pt)

(c) A valve to the left of point  $A$  now closes off that end of the pipe. The section of pipe shown is still full of water, but the water is no longer flowing.

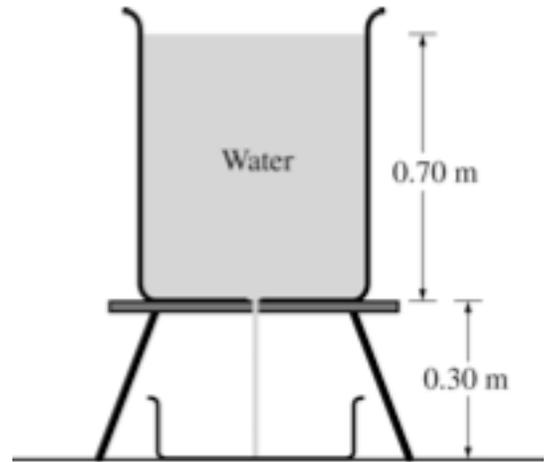

(i) Calculate the absolute pressure at point  $A$  (the pressure that includes the effect of the atmosphere) (1 pt)

(ii) An air bubble forms at point  $A$ . On the figure below, where the dot represents the air bubble, draw a free-body diagram showing and labeling the forces (not components) exerted on the bubble. Draw the relative lengths of all vectors to reflect the relative magnitudes of the forces. (1 pt)

AP B - 2007 Form B, # 4 (10 pt)

A cylindrical tank containing water of density  $1000 \text{ kg/m}^3$  is filled to a height of  $0.70 \text{ m}$  and placed on a stand as shown in the cross section to the right. A hole of radius  $0.0010 \text{ m}$  in the bottom of the tank is opened. Water then flows through the hole and through an opening in the stand and is collected in a tray  $0.30 \text{ m}$  below the hole. At the same time, water is added to the tank at an appropriate rate so that the water level in the tank remains constant.

(a) Calculate the speed at which the water flows out from the hole.

(b) Calculate the volume rate at which water flows out from the hole.

(c) Calculate the volume of water collected in the tray in  $t = 2.0$  minutes.

~~(d) Calculate the time it takes for a given droplet of water to fall  $0.25 \text{ m}$  from the hole.  $\rightarrow$  You may omit this part!~~
